

module One

Class 16

Exception Handling

When we run a program in python there are various exceptions that can be raised.

like - **Syntax Error** , **name error** , **Zero division error** etc

Exceptions are raised when the program is syntactically correct, but the code results in an error. This error does not stop the execution of the program, however, it changes the normal flow of the program.

So you cannot handle the Syntax error. but if there is no syntax error you can handle them.

Exception Handling Functionalities

Try - This will Catch the exception if any and pass to -

Except - Except will deal with the Exception you can have Custom Exceptions or Universal Catcher.

Else - Else will be executed if no exception occurs or it wont be executed

Finally - This will definitely run no matter what happens

Raise - Raises a custom error as you need.
