Class 17

File Handling

File handling in python, as the name suggests it deals with files with python.

That means creating , reading , updating and deleting (CRUD) operations in different files.

File Handling Functionalities

`open()` - to open a file we need to write `open()` it accepts two parameters, 1st location of the file , 2nd mode of the file ("`r`", "`a`", "`w`", "`x`")

"`r`" - for reading the file . error if file does not exist.

"`a`" - for appending in file. creates a file as well.

"`w`" - overwriting the file. Creates if it does not exist.

"`x`" - creates a file . error if file already exist.

with `open()` as fs:

This With functionality will open the file and automatically closes the file once you are done.

Project File and Folder Crud

Lets create a project of File handling
