

module One

Class 14

Intro to Dictionary

Dictionary is also used to store multiple values, but unlike sets, it stores data in key-value pairs.

Syntax of Dictionary: We use {} to denote a dictionary, with each item in the format key: value.

Dictionaries are unordered in older Python versions (before 3.7), but in modern Python, they maintain insertion order.

Dictionaries are mutable, which means you can change, add, or remove items after creation.

Dictionaries do not allow duplicate keys, but values can be duplicated.

The dict() Constructor: You can create a dictionary using dict() as well.

Dictionary Traversing

Dictionary Traversing can be done on the Basis of Keys aswell Values.

Dictionary Methods

There are not much methods of Dictionary lets see some in action.
